

Lecture 2

Wednesday, January 12, 2022 8:09 PM

①

LECTURE NO. 2

①

MATH 221, LINEAR ALGEBRA

RECALL THAT **TWO** MATRICES
ARE EQUAL IF THE CORRESP-
ONDING ENTRIES ARE SAME
AND **BOTH** ARE OF THE SAME
SIZE (ORDER) AS WELL.

E.G. $A = \begin{bmatrix} 2 & 1 \\ 3 & 4 \end{bmatrix}, B = \begin{bmatrix} 2 & 1 \\ 3 & 4 \end{bmatrix}$

$\Rightarrow A = B$

(2) ∵ BY THE DEFINITION OF EQUAL (2)
MATRICES THE LINEAR SYSTEM

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1$$

$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2$$

$$\vdots \qquad \qquad \qquad \vdots \qquad \qquad \qquad \vdots \\ a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n = b_m$$

CAN BE WRITTEN AS

$$\begin{bmatrix} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n \\ \vdots \\ a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_m \end{bmatrix}$$

FURTHER THE $m \times 1$ MATRIX
ON THE LEFT HAND SIDE

CAN BE WRITTEN AS
THE PRODUCT OF TWO
MATRICES GIVEN BY

3]

$$\begin{bmatrix} a_{11} & a_{12} \dots & a_{1n} \\ a_{21} & a_{22} \dots & a_{2n} \\ \vdots & \vdots & \vdots \\ a_{m1} & a_{m2} \dots & a_{mn} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_m \end{bmatrix}$$

mxn MATRIX

IF WE DESIGNATE THESE MATRICES BY A , X AND B , RESPECTIVELY, THE ORIGINAL SYSTEM OF m EQUATIONS IN n UNKNOWN HAS BEEN REPLACED BY THE SINGLE MATRIX EQUATION

$AX = B$, WHERE A IS CALLED THE COEFFICIENT MATRIX. BUT NOTE THE FOLLOWING:

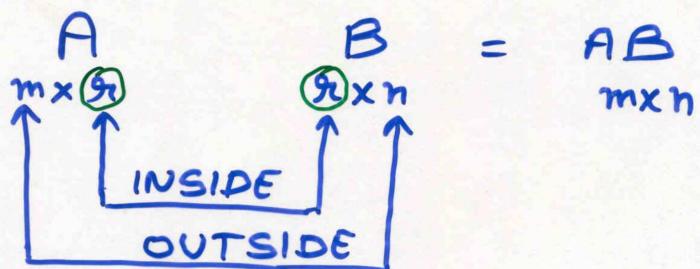

$$\begin{array}{c} A \quad X \quad B \\ \uparrow \quad \uparrow \quad \uparrow \\ mxn \quad nx1 \quad mx1 \\ \text{INSIDE} \quad \text{OUTSIDE} \end{array} =$$

NO. OF COLUMNS OF A = NO. OF ROWS OF $X = n$

4]

P. 27 \rightarrow 27 (8th ED.), P. 28 (7th ED.)
(MULTIPLICATION OF MATRICES)

TWO MATRICES A AND B CAN
BE MULTIPLIED IF THE NUMBER
OF COLUMNS OF A ARE EQUAL
TO THE NUMBER OF ROWS
OF B .

BUT HOW TO MULTIPLY?
CONSIDER THE FOLLOWING
EXAMPLE:

FIND AB , WHERE

$$A = \begin{bmatrix} 1 & 2 & 4 \\ 2 & 6 & 0 \end{bmatrix}^{\text{2x3}}, B = \begin{bmatrix} 4 & 1 & 4 & 3 \\ 0 & -1 & 3 & 1 \\ 2 & 7 & 5 & 2 \end{bmatrix}^{\text{3x4}}$$

SOLUTION: SINCE A IS A 2×3 MATRIX AND B IS A 3×4 MATRIX,
THE PRODUCT AB IS 2×4 MATRIX.

5)

$$\begin{aligned}
 & AB \\
 & = \begin{bmatrix} 1 & 2 & 4 \\ 2 & 6 & 0 \end{bmatrix} \begin{bmatrix} 4 & 1 & 4 & 3 \\ 0 & -1 & 3 & 1 \\ 2 & 7 & 5 & 2 \end{bmatrix} \rightarrow 3 \times 4 \\
 & = \begin{bmatrix} C_{11} & C_{12} & C_{13} & C_{14} \\ C_{21} & C_{22} & C_{23} & C_{24} \end{bmatrix} = C \text{ (SAY)} \quad 2 \times 4
 \end{aligned}$$

TO FIND C_{11} IN (AB) OR (C) ,
 SINGLE OUT ROW ONE FROM THE
 MATRIX A AND COLUMN ONE FROM
 THE MATRIX B. MULTIPLY THE
CORRESPONDING ENTRIES FROM
THE ROW AND COLUMN TOGE-
THEIR AND THEN ADD UP THE
RESULTING PRODUCTS i.e.

$$C_{11} = 1(4) + 2(0) + 4(2) = 12$$

SIMILARLY

$$C_{12} = 1(1) + 2(-1) + 4(7) = 27$$

$$C_{13} = 1(4) + 2(3) + 4(5) = 30$$

$$C_{14} = 1(3) + 2(1) + 4(2) = 13$$

$$C_{21} = 8, \quad C_{22} = -4, \quad C_{23} = 26, \quad C_{24} = 12.$$

⑥

FINALLY

$$AB = \begin{bmatrix} 12 & 27 & 30 & 13 \\ 8 & -4 & 26 & 12 \end{bmatrix} \rightarrow 2 \times 4$$

DEFINITION: (P. 26) /^{8th ED.}, P. 27/TEHED.

IF \boxed{A} IS ANY MATRIX AND \boxed{c} IS ANY SCALAR, THEN THE PRODUCT \boxed{cA} IS THE MATRIX OBTAINED BY MULTIPLYING EACH ENTRY OF \boxed{A} BY \boxed{c}

EXAMPLE: IF $A = \begin{bmatrix} 2 & 3 & 4 \\ 1 & 3 & 1 \end{bmatrix}$

$$2A = \begin{bmatrix} 4 & 6 & 8 \\ 2 & 6 & 2 \end{bmatrix}$$

NOTE: TWO MATRICES \boxed{A} AND \boxed{B} COMMUTE IF $\boxed{AB = BA}$ BUT IN GENERAL $\boxed{AB \neq BA}$

(P. 38) / 7th ED.
(P. 37) / 8th ED.

EXAMPLE: LET $A = \begin{bmatrix} -1 & 0 \\ 2 & 3 \end{bmatrix}$
 $B = \begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix}$, FIND \boxed{AB} AND \boxed{BA}

SOLUTION:

$$AB = \begin{bmatrix} -1 & -2 \\ 11 & 4 \end{bmatrix} = \begin{bmatrix} -1 & -2 \\ 11 & 4 \end{bmatrix}$$

$$BA = \begin{bmatrix} 1 & 2 \\ 3 & 0 \end{bmatrix} \begin{bmatrix} -1 & 0 \\ 2 & 3 \end{bmatrix} = \begin{bmatrix} 3 & 6 \\ -3 & 0 \end{bmatrix}$$

WHICH SHOWS THAT

$$\boxed{AB \neq BA}$$

TRY THE FOLLOWING:
 IF \boxed{A} AND \boxed{B} ARE TWO ^{SQUARE} MATRICES OF SAME SIZE, THEN
 FIND THE CONDITION SUCH THAT $\boxed{(A+B)^2 = A^2 + B^2 + 2AB}$
NOTE: IN SUCH TYPE OF

8) QUESTIONS DON'T USE MATRIX ENTRIES. JUST USE MATRIX SYMBOLS.

SOLUTION: $(A+B)^2$

$$= (A+B)(A+B) = A^2 + \underline{AB+BA} + B^2$$

IF \boxed{A} AND \boxed{B} COMMUTE THEN

$$\underline{AB = BA}$$

$$\therefore (A+B)^2 = A^2 + 2AB + B^2.$$

NOTE: IF \boxed{A} , \boxed{B} AND \boxed{C} ARE MATRICES SUCH THAT \boxed{AB} AND \boxed{BC} ARE DEFINED THEN $\boxed{A(BC) = (AB)C}$, WHICH IS ALSO CALLED ASSOCIATIVE LAW FOR MULTIPLICATION.

EXAMPLE: IF $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 0 & 1 \end{bmatrix}$,

$$B = \begin{bmatrix} 4 & 3 \\ 2 & 1 \end{bmatrix}, C = \begin{bmatrix} 1 & 0 \\ 2 & 3 \end{bmatrix}$$

(P. 39)

THEN PROVE THAT

$$(AB)C = A(BC)$$

9]

SOLUTION:

$$AB = \begin{bmatrix} 1 & 2 \\ 3 & 4 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 4 & 3 \\ 2 & 1 \end{bmatrix} = \begin{bmatrix} 8 & 5 \\ 20 & 13 \\ 2 & 1 \end{bmatrix}$$

$$(AB)C = \begin{bmatrix} 8 & 5 \\ 20 & 13 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 2 & 3 \end{bmatrix} = \begin{bmatrix} 18 & 15 \\ 46 & 39 \\ 4 & 3 \end{bmatrix}$$

SIMILARLY

$$A(BC) = A \begin{bmatrix} 10 & 9 \\ 4 & 3 \end{bmatrix} = \begin{bmatrix} 18 & 15 \\ 46 & 39 \\ 4 & 3 \end{bmatrix}$$

(CHECK)

BASIC RESULTS:

① IF A IS $m \times n$ MATRIX AND
 D IS A DIAGONAL MATRIX OF
 OF ORDER m THEN FIND THE
MULTIPLICATION RULE FOR DA .

SOLUTION: DA

$$= \begin{bmatrix} d_1 & 0 & \dots & 0 \\ 0 & d_2 & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & \dots & \dots & d_m \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}$$

$$= \begin{bmatrix} d_1 a_{11} & d_1 a_{12} & \dots & d_1 a_{1n} \\ d_2 a_{21} & d_2 a_{22} & \dots & d_2 a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ d_m a_{m1} & d_m a_{m2} & \dots & d_m a_{mn} \end{bmatrix}$$

10) $\therefore DA$ IS OBTAINED BY MULTIPLYING d_1 WITH FIRST ROW OF A, d_2 WITH SECOND ROW OF A, ..., AND FINALLY d_m WITH mth ROW OF A.

NOTATION: \rightarrow DIAGONAL MATRIX OF ORDER n .

$$D = \begin{bmatrix} d_1 & 0 & \dots & 0 \\ 0 & d_2 & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & \dots & \dots & d_n \end{bmatrix} = \text{diag}(d_1, d_2, \dots, d_n)$$

② IF A IS $m \times n$ MATRIX AND $E = \text{diag}(e_1, e_2, \dots, e_n)$ THEN AE IS OBTAINED BY MULTIPLYING THE FIRST COLUMN OF A BY e_1 , ..., n th COLUMN OF A BY e_n

$$\because \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix} \begin{bmatrix} e_1 & \dots & 0 \\ 0 & e_2 & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & \dots & \dots & e_n \end{bmatrix}$$

$$= \begin{bmatrix} e_1 a_{11} & e_2 a_{12} & \dots & e_n a_{1n} \\ \dots & \dots & \ddots & \dots \\ e_1 a_{m1} & e_2 a_{m2} & \dots & e_n a_{mn} \end{bmatrix}$$

11)

③ IN THE LAST **TWO** RESULTS
WHAT SHOULD BE THE VALUES
OF d_1, d_2, \dots, d_m AND $e_1, e_2, \dots,$
 \dots, e_n S.t. $AE = A$ AND $DA = A$

ANSWER: ONLY POSSIBLE VALUES
ARE $d_1 = d_2 = \dots = d_m = 1$ AND
 $e_1 = e_2 = \dots = e_n = 1$, IN BOTH
CASES THE DIAGONAL MATRICES
E AND **D** BECOME A SPECIAL
MATRIX WHICH IS CALLED THE
IDENTITY MATRIX.

NOTATION: $E = I_n$ OR JUST **I**
 $D = I_m$ OR JUST **I**

$$I = \begin{bmatrix} 1 & 0 & 0 & \cdots & 0 \\ 0 & 1 & 0 & \cdots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & \cdots & \cdots & \cdots & 0 \end{bmatrix}$$

④ IF **A** IS A MATRIX OF ORDER
n THEN $AI_n = I_n A = A$,
THIS MEANS THAT **I_n**
COMMUTES WITH EVERY.

12]

MATRIX WITH WHICH IT MULTIPLIES.

(P.42 7TH ED.)

INVERSE MATRICES: (P. 41) / 8TH ED.

IF \boxed{Q} IS A SQUARE MATRIX
AND \boxed{R} IS ALSO A SQUARE MATRIX,
(BOTH OF ORDER \boxed{n}) THEN \boxed{Q}
IS SAID TO BE AN INVERSE OF
 \boxed{A} IF AND ONLY IF

CONVERSE
HOLDS

$$\boxed{QR = A^{-1}Q = I_n = I} \text{ AND}$$

IS DENOTED BY $\boxed{A^{-1}}$ i.e. $Q = A^{-1}$

NOTE: ① THE MATRIX \boxed{A} IS
DESCRIBED AS NONSINGULAR
OR INVERTIBLE IF AN INVERSE
OF \boxed{A} EXISTS, AND SINGULAR
IF NO INVERSE OF \boxed{A} EXISTS.

② BOTH \boxed{Q} AND \boxed{A} ARE
SQUARE MATRICES OF
ORDER \boxed{n} BECAUSE THEY
ARE COMMUTING TO GIVE
 $\boxed{I_n}$.

Try this

$$\begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \begin{bmatrix} -\frac{17}{18} & \frac{8}{18} \\ -\frac{2}{18} & \frac{3}{18} \\ \frac{13}{18} & -\frac{4}{18} \end{bmatrix}$$

What do we get?

Exercise Set 1.3

Questions 1 (a) (b) (c) (d) (e) (f), Q7 (read and understand example 7 for this), Q8 (read and understand example 9 for this), Q12, Q13, Q17, Q18 (a)
